Summary

Senior backend engineer with 8+ years building distributed booking and payment systems in Go and Java. Owns the core flight booking services at Tiket.com, which handle 50,000 to 75,000 flight bookings a day and 5x surges at holiday peaks. Known for making the booking path reliable, with idempotent booking, failure recovery, and health monitoring.

Experience

Tiket.com Jakarta, Indonesia
Senior Software Engineer II, Backend Jul 2026 – Present

- Designed and built server-side cart management for flight checkout so users can recover an expired cart in one tap and get a reminder when they abandon one, improving the look-to-book ratio by about 15%.
- Made booking idempotent across all 7 booking API versions to close a race condition that could book the same order twice with the airline, cutting duplicates from 100–200 a day to zero.
- Fixed a memory leak outside the Java heap that crashed every flight-cart pod about 12 times a month. The cause was HTTP responses that were never released and compression that fragmented memory. Crashes dropped to zero.
- Built booking health monitoring across 4 flight services that alerts on drops in supplier booking success and order creation, so the team detects booking incidents within 5 minutes.
- Led system design reviews, wrote architecture decision records, ran on-call and incident post-mortems, and interviewed backend candidates, in a team of 5 engineers.

Senior Software Engineer, Backend Aug 2022 – Jul 2026

- Led the consolidation of fragmented MongoDB databases into one cluster and redesigned the data model to remove cross-database joins, cutting p99 latency by 40% and database cost by about 30%. Later reused by other verticals.
- Led the Flight + Hotel package booking project across two independent booking systems. Built a saga orchestrator in Go with compensating transactions to prevent charged-but-unbooked orders.
- Split tightly coupled legacy flight services into separate services and standardized shared internal libraries across squads, so teams ship features in parallel and new engineers ramp up about 35% faster.
- Created a rule-based pricing engine for add-ons that lets product teams launch pricing changes without a deployment, lifting upsell conversion by about 13%.
- Cut Redis memory from 48% to 15% of capacity with Snappy compression, and prevented cache stampedes.
- Shipped real-time anomaly detection on Kafka that auto-blocks booking bursts from one device and IP.
- Proposed the technical direction for Flight-Core, recommending incremental migration over a full Go rewrite.

SiCepat Express Jakarta, Indonesia
Software Engineer, Backend Jul 2021 – Jul 2022

- Implemented idempotent event processing for shipment tracking on Kafka and Redis, so no event is lost or applied twice and customers and merchants always see the correct shipment status.
- Built an OCR pipeline to verify merchant ID cards automatically, cutting merchant onboarding time by about 50%.

Warung Pintar Jakarta, Indonesia
Software Engineer, Backend Jan 2020 – Jul 2021

- Developed Kafka-based notification and wallet services processing over 100,000 messages a day.

Angsur Bandar Lampung, Indonesia
Software Engineer Jan 2018 – Oct 2019

- Built credit underwriting APIs, cutting credit validation time by about 30%.

Skills

Languages: Go, Java (Spring Boot, Spring WebFlux, Project Reactor), Python, SQL
Data and messaging: MongoDB, PostgreSQL, Redis, Elasticsearch, Kafka, NATS
Infrastructure: GCP, Kubernetes, Docker, microservices, gRPC, GraphQL, Grafana, distributed tracing, SLO alerting

Education

B.Eng. Informatics Engineering, Institut Teknologi Sumatera, 2020, *Cum Laude* (GPA 3.66/4.00)
Teaching: Go and system design instructor (part-time, 2022–2024) in a Ruangguru program run with Indonesia's Ministry of Education, mentoring 200 university students across 5 batches.
Awards: ICPC Asia Jakarta Regional finalist, ranked 21st
